XI. References S81

I. General Considerations

All reagents were purchased and used as received unless otherwise noted. Cu salts were purchased from Aldrich. Boronic acids and C–H substrates were purchased from Oakwood, Combi-Blocks, Chem-Impex, or Aldrich. Ligands were purchased from Aldrich. 2-Methyl-2,4-pentanediol was purchased from TCI America. Toluene was used from a solvent system dried by molecular sieves. All peroxides and oxidants were used as received from Aldrich and Combi-Blocks. In the experimental section, “readily purchasable” refers to availability from a vendor for less than $500.00 per gram, without a special order.

All coupling reactions were set up in an LC Technology Solutions nitrogen-filled glovebox, except where specifically noted. 1H and 13C NMR spectra were recorded on a Bruker 400 spectrometer or a Bruker 500 spectrometer and chemical shifts are reported in parts per
million (ppm), referenced to CDCl₃ at 7.26 ppm (¹H) and 77.16 (¹³C). Chromatography was performed using an automated Biotage Isolera® with reusable 120g or 60g Biotage® SNAP Ultra C-18 cartridges or standard silica cartridges. High-resolution mass spectra were obtained using a Thermo Q Exactive™ Plus via (ASAP-MS) by the mass spectrometry facility at the University of Wisconsin (funded by NIH grant: 1S10OD020022-1). GC analyses were performed on a Shimadzu gas chromatograph (GC-2010 Plus) using a Phenomenex® Zebron™ ZB-Wax capillary column (30 m x 0.25 mm x 0.25 µm film thickness).

II. General Procedure for 2-Aryl-4,4,6-trimethyl-1,3,2-dioxaborinane (ArBdiol) Synthesis

Set-up: To a 15 mL vial was added boronic acid (1 equiv.), 2-methyl-2,4-pentanediol (1.1 equiv.), and dichloromethane (0.5 M). The reaction was then capped and stirred for 16 h at r.t.

Work-up: The reaction mixture was washed 1x with saturated NaHCO₃, and the aqueous phase was then extracted with dichloromethane. The organics were combined and washed 1x with saturated NaHCO₃ and 1x with brine. After washing, the organics were combined, dried with MgSO₄, and concentrated to afford the product. Products showing discoloration were passed through a silica plug with 90% pentane/Et₂O to remove trace impurities. If a precipitate formed from the pentane/Et₂O, the precipitate was filtered, and either the filtered material or filtrate was isolated as the product (without further purification).

III. General Procedure for Cu-Catalyzed Intermolecular Methylarene C–H Arylation

Set-up: In a nitrogen-filled glovebox, a disposable 15 mL glass vial was charged with Cu·DMS complex (0.015 mmol, 3.6 mg, 0.03 equiv.), 1,10-phenanthroline (0.075 mmol, 13.5 mg, 0.15 equiv.), the requisite aryl dioxaborinane (0.5 mmol, 1.0 equiv.), the methyl arene coupling partner (1.6 mL, 0.3 M), di-tert-butyl peroxide (2.0 mmol, 366 µL, 4.0 equiv.), and a Teflon stir bar. The vial was then capped with a PTFE-lined pierceable cap and removed from the glovebox. After tapping the cap with electrical tape, the vial was placed in an aluminum heating block on a heated stir plate, and the mixture was stirred at 90 °C for 48 h.

Work-up: At the end of the reaction, the mixture turned a red/brown color. The vial was then removed from the heat/stir plate and allowed to cool to room temperature. Dibromomethane was then added via syringe as ¹H NMR internal standard (0.5 mmol, 35 µL, 1 equiv.), and an aliquot of the reaction mixture was taken for analysis by ¹H NMR to determine the calibrated yield. The reaction was then condensed by rotary evaporation (taking care not to remove the desired product). The methyl arene starting material is sometimes removed in this step. The crude reaction mixture was then diluted with 100:1 pentane:EtOAc and a portion of it was passed over a silica plug, yielding a colorless or red/yellow solution (for normal phase columns, the crude reaction mixture was instead diluted with 9:1 pentane:EtOAc and then filtered over a syringe filter). The pentane:EtOAc was removed by rotary evaporation, and the mixture was then purified using automated reverse phase column chromatography (Biotage; MeOH/H₂O with 0.1% TFA gradient; DCM was used to load the sample) or automated normal phase column chromatography (Biotage; pentane:EtOAc gradient). For reverse phase columns, the purified product fractions were collected and extracted 2x with 9:1 pentane:Et₂O and brine. These organic layers were collected, dried by MgSO₄, and the solvent was removed to yield the desired 1,1-diaryltrimethane.
IV. General Procedure for Cu-Catalyzed Intermolecular Alkyl Arene C–H Arylation

Set-up: In a nitrogen-filled glovebox, a disposable 15 mL glass vial was charged with either 5 or 3 mol% CuI•DMS complex (0.025 mmol, 6.0 mg, 0.05 equiv. or 0.015 mmol, 3.6 mg, 0.03 equiv.), 1,10-phenanthroline or 1,10-phenanthroline-5,6-dione ligand (0.075 mmol, 13.5 mg or 15.8 mg respectively, 0.15 equiv.), the requisite aryl dioxaborinane (0.5 mmol, 1.0 equiv.), the alkyl arene coupling partner (5 mmol, 10.0 equiv.), di-tert-butyl peroxide (2.0 mmol, 366 µL, 4.0 equiv.), chlorobenzene solvent (313 µl, 1.6 M), and a Teflon stir bar. The vial was then capped with a PTFE-lined pierceable septum cap and removed from the glovebox. After taping the cap with electrical tape, the vial was placed on an aluminum heating block on a heated stir plate, and the reaction mixture was stirred at 90 °C for 48 h.

Work-up: Identical to that in III. Reactions sometimes needed to be filtered with a syringe filter before they are passed through the silica plug with 100:1 pentane:EtOAc (particularly for the 1-chloro-3-phenylpropane substrates).

V. Procedure for Glovebox-Free Cu-Catalyzed Benzylic C–H Arylation of 4-Ethylanisole

Set-up: In a fume hood, a disposable 24 mL glass vial was charged with CuI•DMS complex (12.3 mg, 0.051 mmol, 0.03 equiv.), 1,10-phenanthroline-5,6-dione (53.7 mg, 0.255 mmol, 0.15 equiv.), 2-(3,4,5-methoxyphenyl)-4,4,6-trimethyl-1,3,2-dioxaborinane (500 mg, 1.7 mmol, 1.0 equiv.), 4-ethylanisole (2.4 mL, 17 mmol, 10.0 equiv.), di-tert-butyl peroxide (1.2 mL, 6.8 mmol, 4.0 equiv.), chlorobenzene solvent (1 ml, 1.6 M), and a Teflon stir bar. The vial was then capped with a PTFE-lined pierceable septum cap and taped with electrical tape. The septum was pierced and the vial was evacuated and then backfilled with N2 three times (evacuate/backfill quickly or freeze-pump-thaw to avoid bumping). It was then placed on an aluminum heating block on a heated stir plate and stirred at 90 °C for 24 h.

Work-up: Identical to that in III., except dichloromethane was used as the eluent for the silica plug. This product was isolable using normal-phase flash chromatography. The first several fractions of the column contained pure 4-ethylanisole starting material (76% of the unreacted starting material, i.e. 12 mmol of 15.81 mmol, was recovered)

Glovebox-free reaction after 24 h.

VII. Additional Experiments and Observations

Figure S1 shows the effect of increasing the ligand:Cu ratio in the benzylic arylation reaction. As the ligand:Cu ratio increases from 0.5 to 6, formation of the desired product B increases and biaryl side-product C decreases. Only trace amounts of protodeboronation of the boronic ester is detected (D). The only other product that consumes >5% of the boronic ester is E, which is likely the result of arylation of in situ-generated bibenzyl. The amount of E is relatively constant once the ligand:Cu ratio exceeds 1.

**Figure S1**: Product Distribution as a Function of the Ligand:Cu Ratio. Reactions run on 0.4 mmol scale and yields analyzed by $^1$H NMR and $^{19}$F NMR with 1 eq.CH$_2$Br$_2$ and 1 eq. CF$_3$Ph as internal standards.
Figure S2 compares the distribution of ArBdiol- and ArBpin-derived products. The data show that more biaryl is generated with ArBpin than with ArBdiol. This outcome may arise from more-rapid transmetalation by ArBpin, resulting in a higher concentration of a Cu–Ar species that could undergo disproportionation to generate biaryl. Similar to the data in Figure S1, E is also the only major byproduct when using ArBpin as the nucleophile (only trace amount of protodeboronation to D is observed).

Figure S2: Distribution of Products for ArBdiol vs ArBpin. *Reactions run on 0.4 mmol scale and yields analyzed by $^1$H NMR and $^{19}$F NMR with 1 eq. CH$_2$Br$_2$ and 1 eq. CF$_3$Ph as internal standards. M. B. = mass balance.
Several competition experiments were carried out to probe the selectivity with respect to the arylboron nucleophile. The effect of the electronic property of the arylboronic ester showed a slight preference for the more-electron-rich aryl boronic ester nucleophile (Figure S3A). The effect of the diol fragment in the aryl boronic ester showed a slight preference for the Bpin derivative over the "Bdiol" derivative (i.e., the 4,4,6-trimethyl-1,3,2-dioxaborinane) (Figure S3B). Comparison of Bdiol vs. BF₃K shows exclusive selectivity for 4-F-PhBdiol over PhBF₃K (Figure S3C).

**Figure S3:** Competition Experiments Between Boron Nucleophiles. "Reactions run on 0.4 mmol scale and yields analyzed by ¹H NMR and ¹⁹F NMR with 1 eq.CH₂Br₂ and 1 eq. CF₃Ph as internal standards.
Figure S4A depicts a competition reaction between toluene and ethyl benzene and shows that ethyl benzene undergoes preferential benzylic arylation over toluene in a ratio of 2.3 to 1. Figure S4B depicts an intramolecular competition reaction between the primary and tertiary C–H bonds of cumene. No observed oxidation of the tertiary C–H bond, while 0.33 equiv. of the diaryl methane of cumene was detected by $^1$H NMR. Tertiary C–H bonds appear to be unreactive under the catalytic conditions (See Figure S7).

**Figure S4:** Selectivity Experiment for Primary vs Secondary and Primary vs Tertiary C–H Functionalization. Reactions run on 0.4 mmol scale and yields analyzed by $^1$H NMR and $^{19}$F NMR with 1 eq.CH$_2$Br$_2$ and 1 eq. CF$_3$Ph as internal standards.
In Figure S5 depicts experiments to assess the relative reactivity of methyl arene and diarylmethane C–H bonds. In reaction A, a control experiment is conducted with toluene. In reaction B, diphenylmethane undergoes 25% conversion under standard catalytic conditions, generating primarily 1,1,2,2-tetraphenylethane as the product (via homocoupling of the benzylic radical). In a competition experiment between toluene and diphenylmethane, under conditions reflecting typical reaction conditions, only 10% of diphenylmethane conversion is observed. These observations suggest that the diarylmethane products of the benzylic arylation reactions are not especially susceptible to overoxidation.

Figure S5: Selectivity Experiment for C–H Arylation of a Methyl Arene vs a Diarylmethane. *Reactions run on 0.4 mmol scale and yields analyzed by ¹H NMR and ¹⁹F NMR with 1 eq.CH₂Br₂ and 1 eq. CF₃Ph as internal standards.
Figure S6 provides information on the relative reactivity of secondary and tertiary benzylic C–H bonds, using ethylbenzene and 1,1-diphenylpropane as the substrate. Even in the absence of ethylbenzene, only 1% conversion of the benzylic tertiary C–H bond is observed. When 9 equivalents of ethylbenzene is present (reflecting typical reaction conditions), no conversion of 1,1-diphenylpropane is detected, while ethylbenzene is converted into the corresponding diarylalkane in 57% yield.

Figure S6: Comparative reactivity of ethylbenzene and 1,1-diphenylpropane.  "Reactions run on 0.4 mmol scale and yields analyzed by ^1H NMR and ^19F NMR with 1 eq.CH\textsubscript{2}Br\textsubscript{2} and 1 eq. CF\textsubscript{3}Ph as internal standards.

(4) 4-Trifluoromethyl diphenylmethane: Prepared from 13a (0.5 mmol, 136.0 mg) and toluene (0.3 M, 1.6 mL) according to Section III. Reaction duration: 48 h. Purification: Removed solvent, SiO₂ plug w/ 100:1 pentane/EtOAc, reverse-phase column MeOH/H₂O with 0.1% TFA 89% → 100%, extraction with 90% pentane/Et₂O. Yield: 63% (56%, 66.1 mg), off-white solid.

Yield: 63% (56%, 66.1 mg), off-white solid. Readily Purchasable (CAS): Yes (34239-04-8) Spectra Available in the Literature: Yes

¹H NMR (500 MHz, CDCl₃) δ 7.54 (d, J = 8.0 Hz, 2H), 7.34 – 7.28 (m, 4H), 7.24 (t, J = 7.4 Hz, 1H), 7.18 (d, J = 7.1 Hz, 2H), 4.04 (s, 2H).

¹³C NMR (126 MHz, CDCl₃) δ 145.20 (q, J = 1.6 Hz), 143.25, 139.98, 129.19, 128.94, 128.67, 128.48 (q, J = 32.4 Hz), 126.47, 125.40 (q, J = 3.8 Hz), 41.73.

¹⁹F NMR (377 MHz, CDCl₃) δ -62.37.

(5) 4-Fluorodiphenylmethane: Prepared from 5a (0.5 mmol, 111.1 mg) and toluene (0.3 M, 1.6 mL) according to Section III. Reaction duration: 48 h. Purification: Removed solvent, SiO₂ plug w/ 100:1 pentane/EtOAc, reverse-phase column MeOH/H₂O with 0.1% TFA 85% → 100%, extraction with 90% pentane/Et₂O. Yield: 70% (54%, 50.2 mg), slightly yellow oil.

Yield: 70% (54%, 50.2 mg), slightly yellow oil. The product was obtained from the column as a mixture with <10% biaryl.

OR

(5') Prepared from 1a (0.5 mmol, 102.1 mg) and 4-fluorotoluene (0.3 M, 1.6 mL) according to Section III.

Reaction duration: 48 h. Purification: Removed solvent, SiO₂ plug w/ 100:1 pentane/EtOAc, reverse-phase column MeOH/H₂O with 0.1% TFA 89% → 100%, extraction with 90% pentane/Et₂O. Yield: 70%, slightly yellow oil. Readily Purchasable (CAS): Yes (587-79-1)

Spectra Available in the Literature: Yes

¹H NMR (500 MHz, CDCl₃) δ 7.20 (t, J = 7.5 Hz, 2H), 7.14 – 7.10 (m, 1H), 7.10 – 7.02 (m, 4H), 6.88 (t, J = 8.7 Hz, 2H), 3.86 (s, 2H).

¹³C NMR (126 MHz, CDCl₃) δ 161.44 (d, J = 243.9 Hz), 140.96, 136.79 (d, J = 3.2 Hz), 130.30 (d, J = 7.9 Hz), 128.85, 128.56, 126.23, 115.23 (d, J = 21.2 Hz), 41.11.

¹⁹F NMR (377 MHz, CDCl₃) δ -117.44.
(6) 4-Chlorodiphenylmethane: Prepared from 6a (0.5 mmol, 119.2 mg) and toluene (0.3 M, 1.6 mL) according to Section III.
Reaction duration: 48 h. Purification: Removed solvent, SiO₂ plug w/ 100:1 pentane/EtOAc, reverse-phase column MeOH/H₂O with 0.1% TFA 89%→100%, extraction with 90% pentane/Et₂O.
Yield: 65%, light yellow oil. The product was obtained from the column as a mixture with 12% bibenzyl.
Readily Purchasable (CAS): Yes (831-81-2)
Spectra Available in the Literature: Yes

$^1$H NMR (500 MHz, CDCl₃) δ 7.30 (t, J = 7.5 Hz, 2H), 7.26 (d, J = 8.4 Hz, 2H), 7.24 – 7.20 (m, 1H), 7.17 (d, J = 7.0 Hz, 2H), 7.12 (d, J = 8.4 Hz, 2H), 3.96 (s, 2H).

$^{13}$C NMR (126 MHz, CDCl₃) δ 140.54, 139.57, 131.88, 130.24, 128.85, 128.56, 128.55, 126.28, 41.24.

(7) 4-Bromodiphenylmethane: Prepared from 7a (0.5 mmol, 141.5 mg) and toluene (0.3 M, 1.6 mL) according to Section III.
Reaction duration: 48 h. Purification: Removed solvent, SiO₂ plug w/ 100:1 pentane/EtOAc, reverse-phase column MeOH/H₂O with 0.1% TFA 89%→100%, extraction with 90% pentane/Et₂O.
Yield: 64%, off-white oil. The product was obtained from the column as a mixture with ~20% bibenzyl.
OR
(7') Prepared from 1a (0.5 mmol, 102.1 mg) and 4-bromotoluene (0.3 M, 1.6 mL) per Section III.
Reaction duration: 48 h. Purification: Removed solvent, SiO₂ plug w/ 100:1 pentane/EtOAc, reverse-phase column MeOH/H₂O with 0.1% TFA 89%→100%, extraction with 90% pentane/Et₂O.
Yield: 61% (55%, 67.7 mg), off-white oil.
Readily Purchasable (CAS): Yes (2116-36-1)

13C NMR (126 MHz, CDCl₃) δ 147.50, 139.36, 137.57, 130.16, 128.93, 128.82, 128.19, 125.91, 125.87, 125.60, 45.61, 33.24, 29.77, 20.95.

(38) 1-Phenylindane: Prepared from 1a (0.5 mmol, 102.1 mg) and indane (5.0 mmol, 613 µL) according to Section IV. Uses phd as the ligand with 3 mol % Cu.
Reaction duration: 48 h. Purification: Removed solvent, SiO₂ plug w/ 100:1 pentane/EtOAc, reverse-phase column MeOH/H₂O with 0.1% TFA 89%→100%, extraction with 90% pentane/Et₂O.
Yield: 65%, colorless oil. The product was obtained from the column as a mixture with 35% of the indane homocoupling product.
Readely Purchasable (CAS): No (26461-03-0)
Spectra Available in the Literature: Yes

1H NMR (500 MHz, CDCl₃) δ 7.34 – 7.28 (m, 4H), 7.22 – 7.10 (m, 4H), 6.96 (d, J = 7.4 Hz, 1H), 4.34 (t, J = 8.3 Hz, 1H), 3.06 (dd, J = 15.8, 8.6, 3.7 Hz, 1H), 3.00 – 2.88 (m, 1H), 2.68 – 2.54 (m, 1H), 2.13 – 2.01 (m, 1H).

13C NMR (126 MHz, CDCl₃) δ 146.82, 145.39, 144.31, 128.43, 128.93, 128.09, 126.51, 126.34, 126.32, 124.89, 124.32, 51.63, 36.55, 31.82.
1-Chloro-3,3-diphenylpropane: Prepared from 1a (0.5 mmol, 102.1 mg) and 1-chloro-3-phenylpropane (5.0 mmol, 716 µL) according to Section IV. Uses less chlorobenzene (100 µL, 5.0M) and more di-tert-butyl peroxide (3.0 mmol, 549 µL, 6.0 equiv.), using phen as the ligand with 5 mol% Cu.

Reaction duration: 48 h. Purification: Removed solvent, syringe filtered w/ 100:1 pentane/EtOAc, passed over an SiO₂ plug, ran a reverse-phase column with MeOH/H₂O with 0.1% TFA 70%→100%, extraction with 90% pentane/Et₂O.

Yield: 61% (42%, 47.9 mg), colorless oil.

Readily Purchasable (CAS): No (29648-95-1)
Spectra Available in the Literature: Yes

1H NMR (500 MHz, CDCl₃) δ 7.34 – 7.27 (m, 4H), 7.28 – 7.24 (m, 4H), 7.21 (t, J = 7.2 Hz, 2H), 4.23 (t, J = 7.8 Hz, 1H), 3.47 (t, J = 6.6 Hz, 2H), 2.51 (dt, J = 7.9, 6.6 Hz, 2H).

13C NMR (126 MHz, CDCl₃) δ 143.52, 128.62, 127.86, 126.51, 47.87, 43.21, 38.14.

(41) 1-Chloro-3-(p-tolyl)-3-phenylpropane: Prepared from 21a (0.5 mmol, 109.1 mg) and 1-chloro-3-phenylpropane (5.0 mmol, 716 µL) according to Section IV. Uses less chlorobenzene (100 µl, 5.0M) and more di-tert-butyl peroxide (3.0 mmol, 549 µL, 6.0 equiv.), using phen as the ligand with 5 mol% Cu.

Reaction duration: 48 h. Purification: Removed solvent, syringe filtered w/ 100:1 pentane/EtOAc, passed over an SiO₂ plug, ran a reverse-phase column with MeOH/H₂O with 0.1% TFA 70%→100%, extraction with 90% pentane/Et₂O.

Yield: 45%, white solid. The product was obtained from the column as a mixture with <10% of the 1-chloro-3-phenylpropane homocoupling product.

Readily Purchasable (CAS): No (55707-02-3)

Spectra Available in the Literature: Yes

¹H NMR (500 MHz, CDCl₃) δ 7.29 – 7.08 (m, 9H), 4.17 (t, J = 7.8 Hz, 1H), 3.45 (t, J = 6.6 Hz, 2H), 2.48 (dt, J = 7.9, 6.6 Hz, 2H), 2.30 (s, 3H).

¹³C NMR (126 MHz, CDCl₃) δ 143.79, 140.49, 136.03, 129.29, 128.58, 127.70, 126.51, 47.48, 43.22, 38.18, 20.96.

(42) 1-Chloro-3-(4-iodophenyl)-3-phenylpropane: Prepared from 8a (0.5 mmol, 165 mg) and 1-chloro-3-phenylpropane (5.0 mmol, 716 µL) according to Section IV. Uses less chlorobenzene (100 µl, 5.0M) and more di-tert-butyl peroxide (3.0 mmol, 549 µL, 6.0 equiv.), using phen as the ligand with 5 mol% Cu.

Reaction duration: 48 h. Purification: Removed solvent, syringe filtered w/ 100:1 pentane/EtOAc, passed over an SiO₂ plug, ran a reverse-phase column with MeOH/H₂O with 0.1% TFA 70%→100%, extraction with 90% pentane/Et₂O.

Yield: 48% (37%, 65.8 mg), off-white oil.

Readily Purchasable (CAS): No (N/A)
