Materials and Methods.

General Considerations. All commercially available compounds were purchased from Sigma-Aldrich, and used as received unless otherwise indicated. Solvents were dried over alumina columns prior to use. $^1$H and $^{13}$C NMR spectra for compound characterization were recorded on Bruker AC-300 MHz, Avance-400 MHz, Avance-500 MHz or Varian Mercury-300 MHz spectrometers. Chemical shift values are given in parts per million relative to residual solvent peaks ($^1$H and $^{13}$C) or liquid NH$_3$ ($^{15}$N). High-resolution, exact mass measurements were obtained by the mass spectrometry facility at the University of Wisconsin. Melting points were taken on a Mel-Temp II melting point apparatus. Gas chromatographic analysis of reactions was conducted with a Shimadzu GC-2010Plus gas chromatograph with either a DB-Wax or a RTX-5 column. Flash chromatography was performed using SilicaFlash® P60 (Silicycle, particle size 40-63 μm, 230-400 mesh).

Procedure for Stoichiometric Reaction of phd with 1,2,3,4-tetrahydroisoquinoline: To a solution of phd (4.0 mg, 0.019 mmol) in MeCN-$d_3$ (1.0 mL) containing internal standard (1,3,5-trimethoxybenzene) was added 6.0 equiv of 1,2,3,4-tetrahydroisoquinoline (14.5 µL, 0.114 mmol). Reaction progress was monitored by $^1$H NMR until completion, at which point solids had formed along the walls of the NMR tube. (The liquids could be decanted, and the solids reconstituted in DMSO-$d_6$ + 1 drop TFA to give a spectrum which matched authentic 1,10-phenanthroline-5,6-diol, prepared according to the literature procedure). Low Temperature NMR Characterization of Hemiaminal Intermediate A: General considerations for NMR studies: Low temperature characterization data was obtained using Bruker Avance 500 MHz or Varian INOVA 600 MHz spectrometers. Low temperature correlation spectroscopy was acquired using the following pulse parameters: $^1$H-$^{13}$C HSQC spectral window (f2) of 230 ppm centered at 105 ppm, j1xh = 140.0 Hz, ni = 256, and ns = 2; $^1$H-$^{13}$C HMBC spectral window (f2) of 230 ppm centered at 105 ppm, jnxh = 8.0 Hz, j1xh = 140.0 Hz, ni = 256, ns = 4; $^1$H-$^{15}$N HMBC spectral window (f2) of 400 ppm centered at 150 ppm, jnxh = 7.0 Hz, j1xh = 95.0 Hz, ni = 256, and ns = 128. Chemical shift values are given in parts per million relative to residual solvent peaks ($^1$H and $^{13}$C) or liquid NH$_3$ ($^{15}$N). Unless otherwise indicated, temperature calibrations were determined using a 4% MeOH in CD$_3$OD external standard.

General Procedure for NMR sample preparation: A solution of phd (4.0 mg, 0.019 mmol) in 1.0 mL MeCN-$d_3$ was loaded into an NMR tube. 1,2,3,4-Tetrahydroisoquinoline (14.5 µL, 0.114 mmol, 6.0 equiv) was added, and the sample was frozen in a dry ice/acetone bath to prevent further reaction. The sample was quickly thawed prior to loading into a spectrometer already cooled to -40 °C. When relevant, percent yield was determined from quantitative $^1$H NMR spectra (relaxation delay: 25 s) based on 1,3,5-trimethoxybenzene internal standard.

General Procedure for NMR time courses: A solution of (a) phd (4.0 mg, 0.019 mmol), or (b) phd (4.0 mg, 0.019 mmol) and 0.5 equiv Zn(OTf)$_2$ (3.45 mg, 0.0095 mmol) in 1.0 mL MeCN-$d_3$ was loaded into an NMR tube. The sample was locked, tuned and shimmed in an NMR spectrometer already at -10 °C. The sample was quickly ejected,
1,2,3,4-tetrahydroisoquinoline (14.5 µL, 0.114 mmol, 6.0 equiv) was added, and the sample was re-injected into the spectrometer. Quantitative (1 scan) $^1$H spectra were acquired every 60 or 120 seconds.

**Procedures for aerobic reaction screening**

In a disposable culture tube, 1,10-phenanthroline-5,6-dione (5 mol %, 0.065 mmol), ZnI$_2$ (2.5 mol %, 0.00325 mmol), and PPTS (15 mol %, 0.0195 mmol) were dissolved in 0.5 mL MeCN. 1,2,3,4-Tetrahydroisoquinoline or dibenzylamine (0.130 mmol) was added, and the reaction tube was placed into an aluminum block mounted on a Large Capacity Mixer (Glas-Col) that enabled several reactions to be performed simultaneously under a constant pressure of (approx.) 1 atm O$_2$ with orbital agitation. The headspace above the tubes was filled and purged with oxygen gas multiple times, and then left under constant pressure of O$_2$ for 24 h. Upon completion, the tube was removed and internal standard was added. The reaction solvents were removed, and the residue suspended in CDCl$_3$ and filtered through a short plug of Celite for NMR analysis.

**Kinetic Isotope Effect Studies**

Mono-deuterated 1,2,3,4-tetrahydroisoquinoline, 1-$d_1$, was prepared with >99:1 deuterium incorporation according to the literature procedure.$^2$

**Stoichiometric Reactions: Quinone-mediated oxidation.**

![Reaction scheme](image)

To a solution containing 1.0 equiv phd (10.0 mg, 0.047 mmol), 0.5 equiv Zn(OTf)$_2$ (8.6 mg, 0.023 mmol) and 3.0 equiv PPTS (35.6 mg, 0.141 mmol) in 2.5 mL MeCN was added 6.0 equiv 1-$d_1$ (36 µL, 0.284 mmol). After 1.5 h, a stock solution of 1,3,5-trimethoxybenzene was added and the reaction was concentrated, resuspended in CDCl$_3$, and filtered through a celite plug into an NMR tube. Quantitative NMR analysis showed the reaction yield to be 80% based on phd. The intrinsic KIE was determined to be 6.4 +/- 0.14 (mean +/- s.e.m.) based on three independent experiments.

**Stoichiometric Reactions: Iodine/Triiodide-mediated oxidation.**

![Reaction scheme](image)

after 1.5 h, 45% yield: KIE = 3.8 +/- 0.20
To a solution containing 1.0 equiv I\textsubscript{2} (12.1 mg, 0.047 mmol), 0.5 equiv ZnI\textsubscript{2} (7.6 mg, 0.023 mmol) and 3.0 equiv PPTS (35.6 mg, 0.141 mmol) in 2.5 mL MeCN was added 6.0 equiv 1-\textit{d}\textsubscript{1} (36 µL, 0.284 mmol). After 1.5 h a stock solution of 1,3,5-trimethoxybenzene was added to the reaction mixture and the reaction was diluted with EtOAc and washed with a saturated solution of sodium thiosulfate. The organic phase was dried, concentrated and redissolved in CDCl\textsubscript{3} for NMR. Quantitative NMR analysis showed the reaction yield to be 45% based on phd. The intrinsic KIE was determined to be 3.8 +/- 0.20 (mean +/- s.e.m.) based on five independent experiments.

**Catalytic Reactions: Optimized aerobic conditions.**

![Diagram of the reaction](image)

After 24 h, 52% yield: KIE = 6.4 ± 0.19

To a solution containing 5 mol % phd (4.14 mg, 0.0195 mmol), 2.5 mol % ZnI\textsubscript{2} (3.14 mg, 0.00975 mmol), and 15 mol % PPTS (14.9 mg, 0.585 mmol) in 1.6 mL MeCN containing 1,3,5-trimethoxybenzene and under an O\textsubscript{2} atmosphere (balloon) was added 1-\textit{d}\textsubscript{1} (50 µL, 0.39 mmol). After 24 h the reaction was concentrated, redissolved in CDCl\textsubscript{3}, and filtered through a Celite plug. Quantitative NMR analysis showed the reaction yield to be 52% based on 1 (>10 catalyst turnovers). The intrinsic KIE was determined to be 6.4 +/- 0.19 (mean +/- s.e.m.) based on three independent experiments. A sample run to earlier conversion, stopped after 7 h, was measured to have KIE = 6.5.

**Procedures for catalytic secondary amine oxidation**

Typical procedure for the oxidation of secondary amines is as follows. A 25 mL flask was charged with 1,10-phenanthroline-5,6-dione (10.5 mg, 0.05 mmol, 5 mol %) and amine substrate (1.0 mmol) and 3.0 mL anhydrous MeCN was added. The flask was flushed with O\textsubscript{2} and equipped with an O\textsubscript{2} balloon. A well-dissolved solution of ZnI\textsubscript{2} (7.98 mg, 0.025 mmol, 2.5 mol %) and pyridinium \textit{p}-toluenesulfonic acid, PPTS (37.7 mg, 0.15 mmol, 15 mol %), in 1.0 mL anhydrous MeCN was then added. (Depending on the substrate, once ZnI\textsubscript{2} was added the mixture was observed to change color and/or form a heterogeneous component over the course of the reaction). The reaction was stirred vigorously at room temperature for 24 h or 48 h, or until TLC indicated completion.

**Workup A:** Following reaction completion, the mixture was concentrated by rotary evaporation, suspended in a minimum of chloroform, and directly chromatographed over SiO\textsubscript{2} using EtOAc/Hexanes or EtOAc.

**Workup B:** Following reaction completion, the mixture was diluted in 50 mL EtOAc and washed with 25 mL of 1M NaOH. The aqueous phase was extracted with additional EtOAc (2 x 25 mL). The combined organic phases were washed with 25 mL brine, dried over Na\textsubscript{2}SO\textsubscript{4}, filtered, and concentrated. The reaction crude was then chromatographed over SiO\textsubscript{2} using EtOAc/Hexanes or EtOAc.

**Synthesis of 1,10-phenanthroline-5,6-dione, phd**

The quinone catalyst, phd, was prepared from commercial 1,10-phenanthroline (Sigma Aldrich) according to the method of Eisenberg. 1,10-phenanthroline (4.0 g, 22.0 mmol) and KBr (4.1 g, 34.4 mmol) were combined in a flask, and an ice-cooled mixture of H$_2$SO$_4$ (40 mL) and HNO$_3$ (20 mL) was slowly added to the solids. The mixture was heated to reflux for 3 h, and then dumped onto 500 mL ice. The yellow aqueous solution was carefully neutralized with NaOH to pH = 6 - 7, extracted into CHCl$_3$, dried over MgSO$_4$, and concentrated to give nearly quantitative 1,10-phenanthroline-5,6-dione. The yellow solids were recrystallized from ethanol to give pale yellow, flat needles (1.65 g, 35%): mp (EtOH): 263-264 °C; $^1$H NMR (400 MHz, DMSO) δ 9.01 (dd, 2H, $J = 4.8$, 1.6 Hz), 8.40 (dd, 2H, $J = 7.6$, 1.6 Hz), 7.69 (dd, 2H, $J = 7.6$, 4.8 Hz); $^{13}$C NMR (101 MHz, DMSO) δ 178.25, 154.83, 152.79, 136.16, 129.60, 125.72; EMM (ESI) Calc for C$_{12}$H$_6$N$_2$O$_2$ (M+H): 211.0503, found 211.0500.

1,10-phenanthroline-5,6-dione is also commercially available (Sigma Aldrich).

**Synthesis and Characterization of Substrates**

**Acyclic Secondary Amines**

Dibenzylamine was obtained from commercial sources (Sigma Aldrich) and was used as obtained, without further purification. Other acyclic secondary amines were synthesized by reductive amination, according to the literature method.

**N,N-bis-(4-methoxybenzyl)amine**

Synthesized according to the representative procedure to give a colorless oil whose spectroscopic data matched those previously reported: $^1$H NMR (400 MHz, CDCl$_3$) δ 7.29 (d, $J = 8.6$ Hz, 1H), 6.91 (d, $J = 8.6$ Hz, 1H), 3.84 (s, 6H), 3.77 (s, 4H), 1.55 (s, 1H); $^{13}$C NMR (101 MHz, CDCl$_3$) δ 158.61, 132.58, 129.34, 113.78, 55.30, 52.51.

**Tetrahydroisoquinolines**

1,2,3,4-tetrahydroisoquinoline was obtained from commercial sources (Sigma Aldrich) and was used without further purification. 6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline was prepared by basification of an aqueous solution of 6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline hydrochloride (available from Sigma Aldrich) and extraction of
the neutralized compound into organic solvent. 1-substituted tetrahydroisoquinolines were prepared according to the following representative procedure.

1-(4-chlorophenyl)-1,2,3,4-tetrahydro-6,7-dimethoxyisoquinoline

**Representative Procedure for Imine Formation:** 4-Chlorobenzaldehyde (2.5 g, 17.8 mmol) was dissolved in 100 mL MeOH, and 3,4-dimethoxyphenethylamine (3.0 mL, 17.8 mmol) was added. The reaction was stirred at room temperature for 16 h, forming a white precipitate over this time. The white solids were collected by vacuum filtration, rinsed with 5 mL MeOH, and dried to afford the desired imine as a fine white solid (4.29 g, 79% yield). The filtrate was concentrated, and the remaining solids were suspended in a minimum of methanol, and similarly collected to give an additional 0.548 g, or 89.6% combined yield of the corresponding imine. \(^6\)

**Representative Procedure for Pictet-Spengler:** The thus obtained imine (1.67 g, 5.5 mmol) was dissolved in TFA (10 mL) and heated to reflux for 3 h, or until TLC indicated completion. The reaction was cooled, diluted with water and the solution basified by the addition of 1M NaOH. The aqueous solution was extracted (3 x 75 mL EtOAc or CH\(_2\)Cl\(_2\)), dried over MgSO\(_4\), and concentrated to give 1.67 g of the title compound as a white solid whose spectroscopic data match those previously reported.\(^6\)

Synthesized according to the literature method. A suspension of tryptamine (2.0 g, mmol) and indole-3-carboxaldehyde (1.99 g, mmol) in 5 mL toluene was heated to reflux for 1 h. After this time, the solvents were removed in vacuo, and the viscous residue dissolved in 20 mL CHCl₃. Trifluoroacetic acid (10 mL) was added, and the reaction was stirred for 24 h. The reaction was then neutralized by the addition of Na₂CO₃ (aq) and extracted into CHCl₃ (3 x 100 ml). The combined organic phases were dried over Na₂SO₄, concentrated, and chromatographed to afford a pale yellow solid, mp: decomposed at 170 °C; ¹H NMR (500 MHz, DMSO-d₆) δ 10.99 (s, 1H), 10.39 (s, 1H), 7.44 (d, J = 7.5 Hz, 1H), 7.37 (dd, J = 7.8, 2.6 Hz, 2H), 7.20 (d, J = 7.7 Hz, 1H), 7.16 (d, J = 2.4 Hz, 1H), 7.05 (t, J = 7.5 Hz, 1H), 6.97 (p, J = 7.1 Hz, 2H), 6.88 (t, J = 7.5 Hz, 1H), 5.44 (s, 1H), 3.20 (dd, J = 11.0, 6.0 Hz, 1H), 3.00 (ddd, J = 12.4, 7.6, 4.7 Hz, 1H), 2.80 (q, J = 7.4, 6.3 Hz, 1H), 2.6-2.7 (m, 1H); ¹³C NMR (126 MHz, DMSO-d₆) δ 137.02, 136.67, 136.20, 127.44, 126.84, 124.87, 121.42, 120.66, 119.93, 118.78, 118.48, 117.89, 116.30, 111.85, 111.49, 107.92, 50.16, 42.41, 22.82; Calc for C₁₉H₁₇N₃(M+H): 288.1496, found 288.1495.

Tetrahydroquinazolines

Tetrahydroquinazolines were prepared by condensation of 2-aminobenzylamine with the corresponding aldehyde in MeOH, according to the representative procedure for imine formation, above. Tetrahydroquinazolines exhibit ring-chain tautomerism, resulting in NMR spectra that reflect an equilibrium mixture of species. NMR peak data is given only for the major, ring tautomer unless otherwise indicated.

Indole, 25

From 112 µl of indoline, using workup method A, obtained 95.1 mg (81.2% yield) of indole. Spectroscopic data were identical to commercially available material. $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 8.01 (br s, NH), 7.64 (d, $J$ = 7.6 Hz, 1H), 7.35 (d, $J$ = 8.4 Hz, 1H),
7.1-7.25 (m, 3H), 6.54 (t, J = 2.0 Hz, 1H); $^{13}$C NMR (101 MHz, CDCl$_3$) δ 135.84, 127.91, 124.26, 122.06, 120.82, 119.90, 111.14, 102.65; EMM (EI) Calc for C$_8$H$_7$N (M+H): 117.0573, found 117.1579.

3-methylindole, 26
From 135.4 mg of 3-methylindoline, using workup method A, obtained 106.6 mg (79.9% yield) of 3-methylindole as a white solid; mp 95-97 °C to red oil; $^1$H NMR (400 MHz, CDCl$_3$) δ 7.73 (m, 2H), 7.41 (d, J = 7.6 Hz, 1H), 7.34 (t, J = 6.8 Hz, 1H), 7.28 (t, J = 7.2 Hz, 1H), 7.01 (s, 1H), 2.48 (s, 3H); $^{13}$C NMR (101 MHz, CDCl$_3$) δ 136.36, 128.39, 121.99, 121.79, 119.25, 118.98, 111.74, 111.13, 9.82; EMM (EI) Calc for C$_9$H$_9$N (M+H): 131.0730, found 131.0726. Spectroscopic data were identical to commercially available material.

2-methylindole, 27
From 137.6 mg of the corresponding 2-methylindoline, using workup method A, obtained 124.9 mg as a mixture of product and starting material. This mixture was dissolved in hot hexanes, precipitating out 99.0 mg (73% yield) of title compound as white crystals; mp 58-59°C; $^1$H NMR (500 MHz, CDCl$_3$) δ 7.65 (br s, NH), 7.52 (d, J = 7.5 Hz, 1H), 7.29 (d, J = 8.0 Hz, 1H), 7.05-7.15 (m, 2H), 6.23 (br s, 1H), 2.45 (s, 3H); $^{13}$C NMR (125 MHz, CDCl$_3$) δ 136.07, 135.06, 129.10, 120.96, 119.66, 110.22, 100.43, 13.77; EMM (EI) Calc for C$_9$H$_9$N (M+H): 131.0730, found 131.0726. Spectroscopic data were identical to commercially available material.

Data Collection

A red crystal with approximate dimensions 0.733 x 0.133 x 0.119 mm$^3$ was selected under oil under ambient conditions and attached to the tip of a MiTeGen MicroMount©. The crystal was mounted in a stream of cold nitrogen at 100(1) K and centered in the X-ray beam by using a video camera.

The crystal evaluation and data collection were performed on a Bruker Quazar SMART APEXII diffractometer with Mo K$_\alpha$ ($\lambda = 0.71073$ Å) radiation and the diffractometer to crystal distance of 4.96 cm.

The initial cell constants were obtained from three series of $\omega$ scans at different starting angles. Each series consisted of 12 frames collected at intervals of 0.5° in a 6° range about $\omega$ with the exposure time of 10 seconds per frame. The reflections were successfully indexed by an automated indexing routine built in the
APEXII program suite. The final cell constants were calculated from a set of 9785 strong reflections from the actual data collection.

The data were collected by using the full sphere data collection routine to survey the reciprocal space to the extent of a full sphere to a resolution of 0.70 Å. A total of 153282 data were harvested by collecting 6 sets of frames with 0.5° scans in \( \omega \) and \( \varphi \) with exposure times of 20 sec per frame. These highly redundant datasets were corrected for Lorentz and polarization effects. The absorption correction was based on fitting a function to the empirical transmission surface as sampled by multiple equivalent measurements. [1]

**Structure Solution and Refinement**

The systematic absences in the diffraction data were consistent for the space groups \( Pnma \) and \( Pna2_1 \). The \( E \)-statistics strongly suggested the centrosymmetric space group \( Pnma \) that yielded chemically reasonable and computationally stable results of refinement [2-4].

A successful solution by the direct methods provided most non-hydrogen atoms from the \( E \)-map. The remaining non-hydrogen atoms were located in an alternating series of least-squares cycles and difference Fourier maps. All non-hydrogen atoms were refined with anisotropic displacement coefficients. All hydrogen atoms were included in the structure factor calculation at idealized positions and were allowed to ride on the neighboring atoms with relative isotropic displacement coefficients.

The asymmetric unit contains one Zn complex as well as a heavily disordered non-coordinated triflate anion and two partially occupied acetonitrile molecules. Ligand N3 of the Zn complex is disordered over two positions (major component: 82.0(10)\%). Triflate ligand S1 is also disordered over two positions (major component: 92.8(2)\%). Bond distance and thermal parameter restraints and constraints were applied to the disordered species to enable a computationally stable and chemically reasonable refinement.
A significant amount of time was invested in identifying and refining the disordered non-coordinated triflate anion and acetonitrile molecules. Bond length restraints were applied to model the diffuse species but the resulting isotropic displacement coefficients suggested that the species were mobile. In addition, the refinement was computationally unstable. Option SQUEEZE of program PLATON [5] was used to correct the diffraction data for diffuse scattering effects and to identify the species. PLATON calculated the upper limit of volume that can be occupied by the species to be 1828 Å³, or 27.3% of the unit cell volume. The program calculated 820 electrons in the unit cell for the diffuse species. This approximately corresponds to one triflate anion (592 electrons/cell) and 1.4 molecules of acetonitrile (246 electrons/cell) in the asymmetric unit. It is very likely that these species are disordered over several positions. Based on these results, the formula for the asymmetric unit is: \([\text{C}_1\text{2}_2\text{H}_6\text{N}_2\text{O}_2]_2(\text{O}_3\text{SCF}_3)[\text{C}_2\text{H}_3\text{N}]^+; [\text{O}_3\text{SCF}_3]; 1.4 (\text{C}_2\text{H}_3\text{N})\). Please note that all derived results in the following tables are based on the known contents. No data are given for the diffusely scattering species.

The final least-squares refinement of 551 parameters against 7908 data resulted in residuals \(R\) (based on \(F^2\) for \(I\geq2\sigma(I)\)) and \(wR\) (based on \(F^2\) for all data) of 0.0365 and 0.0939, respectively.

Summary

Crystal data for \(\text{C}_{30}.8\text{H}_{19.2}\text{N}_{6.4}\text{O}_{10}\text{F}_{6}\text{S}_{2}\text{Zn} (M =882.41)\): orthorhombic, space group \(Pnma\) (no. 62), \(a = 21.111(7)\) Å, \(b = 22.086(6)\) Å, \(c = 14.348(6)\) Å, \(V = 6690(4)\) Å³, \(Z = 8\), \(T = 100.0\) K, \(\mu(\text{Mo K}\alpha) = 0.963\) mm⁻¹, \(D_{calc} = 1.752\) g/mm³, 153282 reflections measured (3.384 ≤ 2\(\Theta\) ≤ 55.094), 7908 unique \((R_{int} = 0.0451)\) which were used in all calculations. The final \(R_1\) was 0.0429 (I > 2\(\sigma(I)\)) and \(wR_2\) was 0.1159 (all data).
